
Gas Versus Electricity.

Electricity must be sold at 5d per unit to equal gas at 10s per 1,000 cubic feet.

Electricity at such a price is not conveniently possible in Tuam.

Two opposing lighting concerns in a town of this size is an economically unsound proposition as neither of them can obtain the output necessary for low selling charges, and the public must pay accordingly.

Modern gas lighting is not only cheaper but is more suitable for our damp climate.

Given proper incandescent burners, properly attended to, you have in gas the cheapest, most hygienic and most comfortable light.

Electric light gives no heat, has no ventilating effect and is much more costly.

You can generate electricity much cheaper in your own business by installing a gas engine and dynamo, as there are no establishment charges.

Gas properly used can supply all you require in light, heat and power at the cheapest rate.
